   TechSphere Solutions, a growing IT services company with offices across India, wants to track and monitor gender diversity within its workforce. The HR department frequently needs to know the total number of employees by gender (Male or Female) .
   To solve this problem, the company needs an automated database-driven solution that can instantly return the count of employees by gender through a stored procedure that:

   1. Create a PostgreSQL stored procedure that:
   2. Takes a gender (e.g., 'Male' or 'Female') as input.
   3. Calculates the total count of employees for that gender.
   4. Returns the result as an output parameter.
   5. Displays the result clearly for HR reporting purposes.

   SmartShop is a modern retail company that sells electronic gadgets like smartphones, tablets, and laptops. The company wants to automate its ordering and inventory management process. Whenever a customer places an order, the system must:
   1. Verify stock availability for the requested product and quantity.

2. If sufficient stock is available:
   - Log the order in the sales table with the ordered quantity and total price.
   - Update the inventory in the products table by reducing quantity_remaining and increasing quantity_sold.
   - Display a real-time confirmation message: "Product sold successfully! "
3. If there is insufficient stock, the system must:
   - Reject the transaction and display: Insufficient Quantity Available!"

```sql
--INPUT TABLES:
CREATE TABLE employee_info (
    id SERIAL PRIMARY KEY,
    name VARCHAR(50) NOT NULL,
    gender VARCHAR(10) NOT NULL,
    salary NUMERIC(10,2) NOT NULL,
    city VARCHAR(50) NOT NULL
);
INSERT INTO employee_info (name, gender, salary, city)
